

Scenario 1: Too many goblins

Christian Washer is planning out next week's DnD session. *He wants to have the party fight 50 goblins, but he doesn't want to have to take a long time calculating damage and rolling dice.* First he will login to Roll2000 and press the new session button to begin a session. Then he decides to set up an encounter on by clicking the encounter button. When this happens he can input what enemies he wants to have on the board, and what number of those enemies will appear. This will allow Roll2000 to cycle through each type of enemy and auto-roll and calculate the damage that occurs.

Scenario 2: Learn from others

Jessica Steward is trying to learn more about how to DM a DnD game and wants to reference a session run by an experienced DM. She decides to look at some of the records of other DMs that have used Roll2000 to run their games. From the home page she is able to navigate to the "Session Records" page from the top navigation bar. On this page she can scroll down, looking at the different records that other DMs have chosen to share with the community. Each session record on this page lists the DM's name, session duration, and number of players at the top, followed by a brief description submitted by the DM about what happened during the session. Jessica selects a session that seems interesting and helpful, and clicks on the session taking her to a new page for the specific session. On this new page it lists all of the information that was previously visible along with a screenrecording of the session and an optionally submitted audio recording of the session which Jessica can watch to get a sense of how another DM used Roll2000 to run their game.

Scenario 3: It's too messy!

Jonathan Baker is hosting a D&D session online on Roll20, but as he fills his screen with all sorts of data and important information, his screen gets messy with everything that's happening. *What Jonathan wants is an easier way to keep track of all of the information relevant to the current scene.* He decides to use Roll2000 in order to do this. Roll2000 possesses a function that can read and record player information as well as the map, initiative order, npc information and etc. on a separate page in a short and easy to understand format.
